

Fund Spain and Czechia in stages

Reserve **€225,000 capex and five FTE** for two local hubs. Launch Spain first; release Czechia only after the operating-cost, demand and FX gates pass. The pair leaves €225,000 and two FTE unused against the board ceilings. This is a conditional allocation based on synthetic client economics, not a demand forecast.

Base annual increment	Low / high annual increment	Joint stress annual increment
€198,099.31	€64,619.11 / €331,579.51	€32,179.71

Base simple payback is **1.14 years**; low case 3.48 years; stress 6.99 years. Recurring hub fixed cost is €95,000 a year, already deducted. Capex is a separate year-zero outflow. After one full base operating year, cumulative increment less capex remains €-26,900.69; ramp-up would delay recovery.

Why these two markets

Spain and Czechia generate 40.4% of existing contribution and 35.7% of shipped units. Their combined option ranks first in low, base and high volume cases. Poland plus Spain is the base runner-up: €11,770.47 less annual contribution, €15,000 more capex and one more FTE.

What can overturn the choice

Czechia loses €37,826.95 annually under the prescribed stress; Spain remains positive at €70,006.66. Netherlands plus Spain has the highest feasible stress contribution, €107,630.13, but costs €270,000 and six FTE. If the board prioritizes the defined downside case, choose that portfolio instead. If operating gates fail, retain Spain only or defer both.

The largest unverified inputs

The policy assumes 25% volume uplift and savings on every unit. Every supplied saving/unit exceeds recorded fulfillment cost/unit. The €95,000 combined fixed cost is assumed to cover all recurring hub expense, but payroll, lease and service coverage are unconfirmed. Approve a staged envelope, not an unconditional rollout.

Sources: [S08](#), [S09](#), [S07](#), [S11](#), [S14](#), [S02](#), [S03](#), [S06](#), [S12](#). Calculations: saved order ledger / metrics.json.

Prepared 27 September 2026. 2025 shipments; returns through 31 January 2026 inclusive. Core public calculations use the frozen official archives, not current data. All charts marked €k are rounded; the workbook and JSON retain cents.

A reconciled shipment cohort, not an order-row count

Order reconciliation	Records
Extract pages + corrections	655 + 655 + 18 = 1,328
Less identical repeated rows	13
Less superseded rows	18
Selected distinct order IDs	1,297
Less cancelled / test / 2026 shipment	24 / 18 / 1
Eligible shipped orders	1,254

Selection uses the highest numeric revision before testing eligibility. Corrections replace entire rows. All 12 zero-price shipments (739 units) remain in the cohort and contribute –€14,565.90 after product and fulfillment costs. All 24 blank shipment dates belong to cancelled records; no eligible required fields are missing.

Return reconciliation	Treatment
264 raw return rows	20 exact repeats and one superseded revision removed → 243 IDs
241 eligible returns	1,081 physical units; 481 restocked units
R-CUTOFF: 2026-01-31	Included in original DEU December sale: €54 refund; €29.50 cost recovery
R-LATE: 2026-02-01	€33 refund excluded after cutoff
R-ORPHAN → ABSENT	Quarantined: 2 units, 1 restocked and 60 local currency; no currency/EUR inferred

No eligible order has multiple return IDs in these files; the model nevertheless sums all distinct eligible IDs. Returns are restated against the original shipment month. This is a shipment-cohort view, not a cash receipts calendar. Later returns are deliberately outside the cutoff; late-2025 cohorts are less mature.

Revenue, cash and contribution are different

Gross sales are shipped units × unit price less discounts, excluding taxes. Net sales deduct explicit eligible credits. This is the client's booked-revenue proxy for the analysis; it is not a statutory revenue-recognition opinion. Cash depends on collections, payment terms, actual FX and refund settlement, none of which are supplied. Contribution deducts net product cost and nonrefundable fulfillment but excludes central overhead, hub fixed costs, capex, financing and taxes until separately modeled.

Existing economics favor Spain and Czechia

Country	Units	Net sales €k	Contrib. €k	Margin	Returned units / shipped
DEU	12153	625.8	262.4	41.9%	0.60%
FRA	11880	632.2	276.3	43.7%	1.21%
NLD	12576	697.7	315.6	45.2%	1.15%
POL	13163	761.9	356.5	46.8%	1.37%
CZE	13733	815.3	397.3	48.7%	2.10%
ESP	13931	850.8	421.9	49.6%	1.81%

2025 contribution before any local hub

The group generated **€4,383,791.76 net sales** and **€2,030,010.48 contribution**, a 46.31% margin. Each market has 209 eligible orders; the revenue differences reflect shipped quantities, local prices, discounts, FX and mix rather than more order IDs. No customer identifier exists, so order counts cannot establish customer breadth or retention.

Czechia and Spain have the highest observed returned-unit rates at 2.10% and 1.81%, respectively. Czechia recovered cost on 144 of 288 returned units; Spain on 108 of 252. Product-cost recovery is restricted to actual restocked quantities. Establish disposition controls before scaling either market.

The extracts contain no delivery-time, stockout, conversion or lost-order evidence. Higher contribution makes a market financially attractive under the supplied policy, but does not establish that a local hub will cause incremental demand or that these sites can meet service expectations.

Sources: [S08](#), [S09](#), [S07](#), [S11](#), [S14](#), [S02](#), [S03](#). Calculations: saved order ledger / metrics.json.

Use population and income as context

Population grew most in Spain and Czechia among these six markets between 2022 and 2024; Poland contracted. Germany remains the largest population base and the Netherlands has the highest current-US-dollar GDP per capita. These facts do not overturn the client economics or establish addressable assembly demand.

Population, persons	2022	2023	2024	2022–24
DEU	83,177,813	83,287,273	83,516,593	0.41%
FRA	68,184,457	68,372,286	68,551,653	0.54%
NLD	17,700,982	17,877,117	17,993,485	1.65%
POL	36,821,749	36,687,353	36,559,233	-0.71%
CZE	10,672,118	10,864,042	10,905,028	2.18%
ESP	47,786,102	48,352,528	48,848,840	2.22%

GDP/person, current US\$	2022	2023	2024	2022–24
DEU	50,507	54,777	56,104	11.08%
FRA	40,989	44,700	46,103	12.48%
NLD	59,123	63,516	67,465	14.11%
POL	18,891	22,145	25,104	32.88%
CZE	28,282	31,762	31,828	12.54%
ESP	30,319	33,493	35,327	16.52%

Spain added 1,062,738 people (+2.22%); Czechia added 232,910 (+2.18%). Poland lost 262,516 (–0.71%), while its GDP per capita in current US\$ rose 32.88%. That combination illustrates why these indicators should not be converted into a unit-sales forecast. Nominal US-dollar movements include price and currency effects; they are neither PPP comparisons nor real-income growth.

Evidence vintage and missingness

The archived World Bank responses contain all 18 country-year observations for each indicator, with no missing values. Both responses report **last updated 2026-07-13**; the source-room archive retrieved them on **2026-09-27 UTC**. These are revised historical observations collected after the sales year, not information demonstrated to be available to a 2025 decision-maker. Original values and precision remain in JSON and the workbook.

Sources: [S10](#), [S05](#), [S13](#). Calculations: saved order ledger / metrics.json.

Translate historical sales at historical monthly rates

2025 month	PLN per EUR	CZK per EUR	Published days ¹
2025-01	4.246655	25.163318	22
2025-02	4.172225	25.076650	20
2025-03	4.182010	25.001238	21
2025-04	4.265220	25.038950	20
2025-05	4.253800	24.922857	21
2025-06	4.265771	24.804286	21
2025-07	4.254148	24.624609	23
2025-08	4.261305	24.516619	21
2025-09	4.258886	24.346773	22
2025-10	4.248791	24.315391	23
2025-11	4.237635	24.234050	20
2025-12	4.223857	24.259286	21

¹ Both currencies have the same observation count in each month: 255 published observations each over 2025. Means are arithmetic averages of available published business-day quotes. Full precision is retained; EUR is exactly 1. Do not invert the quote or substitute today's spot rate. Sale and refund conversion both divide local value by the **original shipment month** mean. These reference rates are translation assumptions, not actual transaction rates.

An auditable Czech order example

M5-07-003 shipped 91 SENSOR units on 5 July 2025. Gross CZK188,069.70 ÷ 24.624608695652... = €7,637.47 after half-up cent rounding. Its six returned units carry CZK12,400.20 explicit credit, converted using the same July rate to €503.57. Three restocked units recover €124.50 at the original €41.50 unit cost. Net COGS is €3,652.00; fulfillment is €133.94; contribution is **€3,347.96**.

Select the most recent unit-cost effective date on or before shipment. The July cost changes apply to new July shipments; later returns retain the cost of their original shipment. Gross sales, summed refunds, gross COGS, recovered COGS and fulfillment are rounded per order, half up to cents, then aggregated. Margins are ratios of totals, not averages of order margins.

Sources: [S03](#), [S04](#), [S02](#), [S14](#), [S11](#), [S08](#). Calculations: saved order ledger / metrics.json.

The six hub options have very different economics

Annual increment = $C \times u + U \times (1 + u) \times s - F$, where C is baseline contribution, U shipped units, s saving/unit and F annual fixed cost. Low/base/high uplift u is 10% / 25% / 40%. Prices, mix, unit economics and capacity are held constant. Savings apply to every shipped unit, including free shipments, as instructed by the client policy.

Country	Capex €k	FTE	Fixed €k/yr	Saving €/unit	Recorded fulfill. €/unit
DEU	280	5	95	2.60	1.11
FRA	210	4	85	2.90	1.22
NLD	140	3	65	3.20	1.32
POL	110	3	45	2.40	1.42
CZE	95	2	40	2.10	1.52
ESP	130	3	55	3.00	1.63

Annual increment €k	Low	Base	High	Stress	Base payback, years
DEU	-34.0	10.1	54.2	-13.6	27.75
FRA	-19.5	27.1	73.7	3.1	7.74
NLD	10.8	64.2	117.6	37.6	2.18
POL	25.4	83.6	141.8	-40.7	1.32
CZE	31.5	95.4	159.3	-37.8	1.00
ESP	33.2	102.7	172.3	70.0	1.27

The joint stress adds refunds equal to 3% of original gross sales with no cost recovery and, in PLN/CZK markets, an FX loss equal to 10% of original net sales. It applies both shocks to the entire base-plus-uplift business: $(C - 0.03G - \text{FX loss}) \times 1.25 - C + U \times 1.25 \times s - F$. It is measured against the unchanged normal baseline, so it is more conservative than stressing the incremental volume alone. Defer is zero by the specified comparison convention; this does not imply central operations are immune to shocks.

All savings assumptions exceed the fulfillment costs visible in the ledger. Validate the additional avoidable cost pool and ensure savings are net of local handling. Fixed costs are treated as fully loaded for policy arithmetic, but detailed payroll, rent and coverage are absent. Proposed staff mix: Spain one site lead plus two service/warehouse associates; Czechia one site lead plus one associate. These role designs are assumptions, with no wage or capacity validation.

Simple payback is capex divided by a positive annual increment; otherwise null. Negative stress increments for Germany, Poland and Czechia therefore have no positive stress payback. Capex is not an annual operating expense.

Sources: S06, S12, S02. Calculations: saved order ledger / metrics.json.

Rank every feasible portfolio against deferral

The table includes all 18 feasible choices: six singles, 11 pairs and defer. Pairs add economics without synergy. Ranked by base annual contribution; €k values are rounded. All scenario paybacks are in the workbook and JSON. Unused budget is not a reason to add a lower-value hub.

Rank / option	Capex €k	FTE	Low €k	Base €k	High €k	Stress €k	Base PB yrs
1 CZE+ESP	225	5	64.6	198.1	331.6	32.2	1.14
2 POL+ESP	240	6	58.6	186.3	314.1	29.3	1.29

15 NLD	140	3	10.8	64.2	117.6	37.6	2.18
16 FRA	210	4	-19.5	27.1	73.7	3.1	7.74
17 DEU	280	5	-34.0	10.1	54.2	-13.6	27.75
18 DEFER	0	0	0.0	0.0	0.0	0.0	—

Four infeasible pairs

Pair	Capex / FTE	Reason
DEU+ESP	€410,000 / 8	FTE > 7
DEU+POL	€390,000 / 8	FTE > 7
DEU+NLD	€420,000 / 8	FTE > 7
DEU+FRA	€490,000 / 9	capex > EUR450,000; FTE > 7

Czechia plus Spain also ranks first in the low and high cases. Poland plus Spain is closest in base economics. Netherlands plus Spain ranks fourth in base but first in stress, an important alternative for a board with a downside-first objective. Deferring all avoids capital and staffing commitments while retaining the existing central-hub baseline; its incremental contribution is zero.

Sources: [S06](#), [S12](#). Calculations: saved order ledger / metrics.json.

Make the risk trade-off explicit

Base return versus prescribed joint stress

The proposed pair beats Poland plus Spain in every prescribed scenario, with lower capex and staffing. Its base advantage is only €11,770.47 per year. If Czechia's own uplift falls below **22.24%** while Poland retains 25%, the runner-up overtakes it. This one-way threshold assumes all other inputs are unchanged.

The downside alternative is Netherlands plus Spain: €31,167.88 less base contribution, but €75,450.42 more stress contribution for €45,000 additional capex and one additional FTE. With the full 3% refund shock, an FX haircut above **2.60% of Czech net sales** makes Netherlands plus Spain outperform the recommended pair. Without the refund shock, the crossover is 3.06%. These are policy-style net-sales haircuts, not exact percentage currency depreciation.

CZE+ESP annual €k	No savings	50% savings	Full savings
0%	-95.0	-59.7	-24.4
10%	-13.1	25.8	64.6
25%	109.8	154.0	198.1
40%	232.7	282.1	331.6

With no uplift, even full assumed savings lose €24,367.70 annually. With zero savings the pair needs **11.60% uplift** to break even; low uplift then loses €13,076.43. At base volume with savings capped at all recorded fulfillment cost, annual contribution falls to €164,331.65. This is only a sensitivity: it still assumes all fulfillment cost is avoidable. No probabilities or expected values are assigned to these scenarios.

Sources: [S06](#), [S12](#), [S02](#). Calculations: saved order ledger / metrics.json.

A 90-day plan with capital gates

Proposed sequence, not work already performed. Spain is first because it remains positive in the joint stress without PLN/CZK exposure. Czechia's release is contingent; the plan may end with one hub or continued deferral. Full modeled benefits start only after operational ramp-up, not automatically on day 90.

Stage / accountable owner	Work and dependencies	Decision gate / evidence
Days 1–15 CFO + Finance data lead	Reconcile ledger to client systems; resolve orphan return; define cost pool, service baseline and return cohorts. COO verifies inventory/SKU flow.	Gate 0: zero unexplained reconciliation differences. Document what fixed cost covers. No leases or hiring commitments yet.
Days 16–30 COO + Procurement; Sales lead	Obtain site, carrier and payroll quotes; test route economics with existing operations; log qualified pipeline and comparable conversion. Requires approved pilot cost and clean baseline.	Gate 1, CFO/board: Spain ≤€130k capex / 3 FTE; complete recurring cost estimate. Re-run cases using defensible savings. Demand evidence must support the chosen volume case; pause if low case becomes negative.
Days 31–60 Spain site lead + IT / Supply chain	After Gate 1: prepare Spain site, recruit 1 lead + 2 associates, integrate order/stock/returns records and train staff. Inventory and carrier readiness precede service launch.	Gate 2, COO: inventory accuracy ≥99%, dispatch readiness ≥95% against one-business-day target; 100% traceable trial orders/returns. Release go-live only on acceptance test.
Days 61–90 CFO + COO; Czech site lead	Track Spain cohorts; refresh demand, full cost and FX exposure for Czechia. Proposed Czech staff: 1 lead + 1 associate. Shared internal support effort must be costed.	Gate 3, board: Czechia ≤€95k / 2 FTE. Reassess NLD if FX haircut planning case exceeds 2.60% with full refund shock. If Czech case fails, hold capital or re-submit NLD+ESP.

Gate discipline

CFO owns financial definitions and signs the revised case. COO owns service capacity, safety and carrier readiness. Procurement owns contracted cost coverage; Sales owns qualified pipeline evidence; IT owns event-level instrumentation. The board alone releases each capex tranche or changes the country allocation. Staff limits cover direct hub roles; any additional resourcing must be included in the revised constraint test.

Dependency and schedule risk

Lease availability, recruitment, systems integration and inventory placement are unverified. Do not promise both sites live within 90 days. Separate working capital, pilot spend and startup losses are not supplied and need a funding plan before release; if they cannot fit the envelope or receive board approval, pause the launch. A 90-day observation window cannot establish durable causal uplift or fully mature annual returns.

Sources: [S06](#), [S12](#). Calculations: saved order ledger / metrics.json. Implementation dates, roles and targets are consultant proposals.

Measure service, economics and return quality

Targets below are proposed gates, not observed client service performance. Record event timestamps, orders, units, SKU, currency, gross credits and restock disposition so Finance can recreate the cohort economics. Separate organic growth, price/mix, FX and hub service effects when interpreting uplift.

KPI / owner / cadence	Baseline and definition	Proposed target / action
Contribution run-rate CFO, monthly	Increment after all recurring hub costs. Compare against central baseline using fixed definitions and reconciled orders.	Track €102,716.37 Spain and €95,382.94 Czechia base annual increments after ramp. If rolling 8-week annualized increment is negative, stop expansion and revise plan.
Volume uplift Sales lead, weekly	2025 units: ESP 13,931; CZE 13,733. Normalize by matched calendar weeks and track paid/free mix.	Base assumption 25%; report 10/25/40% range. No causal claim from a before/after comparison; use a matched untreated segment where feasible.
Saving per shipped unit Ops Finance, weekly	Current fulfillment/unit: ESP €1.63; CZE €1.52. Savings targets are €3.00 / €2.10 and require a broader avoidable cost pool.	Demonstrate net avoidable cost in invoices, including local handling. Escalate any unvalidated cost category; recompute low/base before further spend.
Service and inventory Site lead, daily	No historical delivery SLA or inventory-accuracy baseline supplied; establish during days 1–15.	≥95% dispatch within one business day; ≥99% inventory accuracy at launch. Log stockouts and delivery completion, not only dispatch.
Returns and recovery Quality lead, weekly / monthly	Returned units / shipped: ESP 1.81%; CZE 2.10%. Restocked / returned: ESP 42.86%; CZE 50.00%.	On comparable matured cohorts, no increase above baseline rate; no recovery below baseline without root-cause review. Monitor refunds separately as % gross.
FX / capital / staffing Treasury + CFO, monthly	Policy FX haircut is on net sales, not spot quote. Capex ceiling €225k for proposed pair; 5 FTE.	Report CZK cash and translation exposure separately. Escalate planned haircut ≥2.60% with refund shock. No commitments above approved capex/FTE.

Risk controls and honest limits

Uplift is unmeasured: use documented pipeline, matched comparisons and sensitivity gates. Cost scope is incomplete: sign off fully loaded recurring expense and avoidable savings. Currency stress concentrates in Czechia: Treasury should validate invoicing and risk policy before considering hedges; none is priced here. Return maturity differs by cohort: compare like-for-like windows and continue monitoring beyond 90 days. No customer interviews, live client account access or site diligence were performed.

Sources: [S08](#), [S09](#), [S07](#), [S11](#), [S14](#), [S02](#), [S03](#), [S06](#), [S12](#). Calculations: saved order ledger / metrics.json. KPI targets and governance are proposed.

Exact financial bridge and reconciliation

Country	Gross sales EUR	Refunds EUR	Net sales EUR
DEU	€631,244.76	€5,453.00	€625,791.76
FRA	€640,929.94	€8,699.04	€632,230.90
NLD	€709,108.84	€11,376.00	€697,732.84
POL	€776,507.79	€14,617.92	€761,889.87
CZE	€834,572.08	€19,264.61	€815,307.47
ESP	€872,258.92	€21,420.00	€850,838.92
TOTAL	€4,464,622.33	€80,830.57	€4,383,791.76

Country	Net COGS EUR	Fulfillment EUR	Contribution EUR
DEU	€349,980.50	€13,445.70	€262,365.56
FRA	€341,453.00	€14,506.80	€276,271.10
NLD	€365,495.50	€16,593.12	€315,644.22
POL	€386,697.50	€18,698.49	€356,493.88
CZE	€397,062.00	€20,910.22	€397,335.25
ESP	€406,230.50	€22,707.95	€421,900.47
TOTAL	€2,246,919.00	€106,862.28	€2,030,010.48

Gross COGS of €2,265,404.50 less €18,485.50 recovered from restocked goods gives €2,246,919.00 net COGS. Gross sales less refunds gives net sales; subtract net COGS and fulfillment to obtain contribution. Returned units are physical units, not order counts.

Seventy-two country-month records cover all six countries and all twelve calendar months. Every additive metric reconciles exactly from eligible order components to months to country totals. The workbook Reconciliation sheet shows zero differences for orders, units, gross sales, refunds, net sales, net COGS, fulfillment, contribution and returned units. Full monthly records are in the workbook, metrics.json and deliverables/data/monthly.csv.

Margin is contribution divided by net sales, or null when net sales are zero. At group level, the ratio is 46.307183%; average country or order margins would give a different statistic. Fulfillment remains nonrefundable even when product is returned; un reusable returns do not recover COGS.

Synthetic transactions S07–S09, S11	orders-part1.csv, orders-part2.csv, order-corrections.csv and returns.csv. One SKU per order; order and return revisions independently resolved.
Synthetic accounting / options S02, S06, S12, S14	data-dictionary.md, hub-options.csv, scenario-policy.md, unit-costs.csv. Define accounting and scenario rules; costs/uplift are client inputs, not observed public market estimates.
Official public archive S10 / S05	World Bank SP.POP.TOTL and NY.GDP.PCAP.CD. 2022–2024, persons and current US\$/person. Metadata lastupdated 2026-07-13; archive collection 2026-09-27 UTC.
Official public archive S03 / S04	ECB eurofxref historical CSV and ZIP. Selected 2025 PLN/CZK daily quotes; full ZIP extraction checked byte-for-byte against CSV.
Collection / provenance S01 / S13	Frozen source-room index and original source-register.json preserved. Analyst collection time, URL, SHA-256, size, period, units and synthetic/public status recorded for each saved file.

Reproduction and verification

Run `analysis/reproduce.sh` from the project root using the documented Python dependencies. It rebuilds the Decimal model, XLSX and PDFs entirely from saved inputs, then performs independent exact-rational recalculation, workbook/cache consistency and PDF integrity checks. See `README.md` and `VERIFICATION.md` for commands, actual results and rendering notes. No private account, credentials, customer data or live official refresh was accessed.

The scenario arithmetic omits discounted cash flow, taxation, working capital, inflation, financing, implementation delay, hub capacity constraints and pair cannibalization. Baseline contribution is not company profit or free cash flow. Market indicators do not provide product demand, and the scenario rankings have no assigned probability or statistical certainty. Budget release should follow refreshed operational evidence, not treat these illustrative annual run-rates as guarantees.

Preserve the handoff folder structure so relative evidence links remain usable. The complete machine-readable source register contains original and frozen-room URLs, archive and analyst retrieval times, hashes, units and vintage.
